# Smartalock

## Smartalock L2 Installation Guide - With Jig

What you need:

Lock (1 per door)
Wire Cover (1 per door)
Latch (1 per door)
RJ45 Cable (1 per door)
4x40mm Lock screws (3 per door)
4x30mm Wirecover screw (1 per door)
3x16mm Latch Screws (2 per door)

Power Screwdriver
Site Specific Cabling Plan
Installation Jig

1

Smartalock12 Hub

Run cable from the Smartalock12 hub in the toekick space to the correct locker as specified in the Site Specific Cabling Plan. THIS MUST BE DONE FIRST to avoid locking the door before the lock has power.

2

The Jig allows you to position the lock at the correct distance back from the lockers edge. With the lock in the jig, line the front face of the jig with the front face of the locker wall. At the desired lock height, screw 2 lock screws through the centre of the the slotted bosses. These slots will allow you to fine tune the locks positioning later. CONNECT THE CABLE NOW

3

Pin holes marked by jig

THIS WAY UP

With the jig on, firmly press the door shut. The pins will mark the location of the latch screws. Remove Jig and fix latch to wall with 16mm screws provided

4

Ensure controller system is correctly installed and powered on (see guide at http://support.smartalock.com/support/solutions/articles/5000857160-smartalocklite-l2-controller-cabling-guides). Shut the doors until the latch catches. Open lock via unlock switch on the smartalock12 Hub which the lock is connected to. Slightly loosen the screws and slide lock forwards or backwards as required and re-tighten.

5

Once lock is in the correct position secure in place with the third screw.

6

Capping

Wire Cover

Fit the aluminium extrusion capping if appropriate. Press the wire cover into place and fasten with 25mm wood screw. This locker is now complete. Repeat process for all lockers.
